

Enhancing Healthcare with Artificial Intelligence

The real question to answer with healthcare is not **who is at risk**, but **how best to treat them** — effectively, over time and at the lowest cost.

**We have
the answer.**

Raiven Healthcare has developed a cloud-based, real-time predictive analytics platform for use in complex health treatments, where a provider has access to an artificial intelligence (AI) tool that assists in making the best clinical decisions at the optimal cost for a specific patient.

The American healthcare system is undergoing rapid change as organizations move from a fee-for-service to pay-for-performance reimbursement model.

There is not time for clinicians or other care providers to do everything for every patient all the time – and even if they could, they will not get paid for it, nor will all of it be effective. CMS is rapidly shifting its incentive programs toward encouraging the adoption of technology that supports value-based payments, including a strong emphasis on the use of population health management applications.

Unfortunately, even with the growth of healthcare IT applications and compilation of massive amounts of data, we do not believe that today's technology answers the real question in healthcare: what should care providers do right now that they can monitor and adjust over time to improve their patients' health and well-being based on their proven expertise and with limited financial resources?

The GPS for Healthcare

THE RAIVEN ANSWER – Assisted decision making with artificial intelligence

We have developed a cloud-based, real-time, predictive analytics platform for use in complex health treatments, where a provider has access to an artificial intelligence (AI) tool that assists in making the best clinical decisions at the optimal cost for a specific patient.

Our technology is clinically proven using data from a national healthcare provider, demonstrating **40% better outcomes while decreasing cost 60%.**
AI-predicted treatment vs. treatment-as-usual

What organizations use RAIVEN technology?

Our product is ideal for those engaged in risk-based contracts, including accountable care organizations (ACOs) and providers in gainsharing agreements that desire advanced algorithms solving specific problems that translate into actions. In particular, we are focused on care beyond the clinic through case management, since monitoring and improving health for complex conditions such as mental health are always ongoing and necessary.
